

## Deep Cleaning Ruminant and Equine Barns

At least once a year, the barns get a thorough deep cleaning to keep them fresh, keep out pests, and keep the animals' home safe for them.

Supplies:

- Broom & shovel
- Wheelbarrow
- Scrub brushes
- Gloves
- Rescue (diluted)
- Pressure washer (if water level at the sanctuary is okay)
- Stall Dry (water absorption pellets)
- Giant fan (if needed)

Directions:

1. Clean out stall of all shavings and hay (this includes water buckets, hay buckets, and mineral blocks).

2. Take a picture of how the mats are currently situated (you'll need this later)

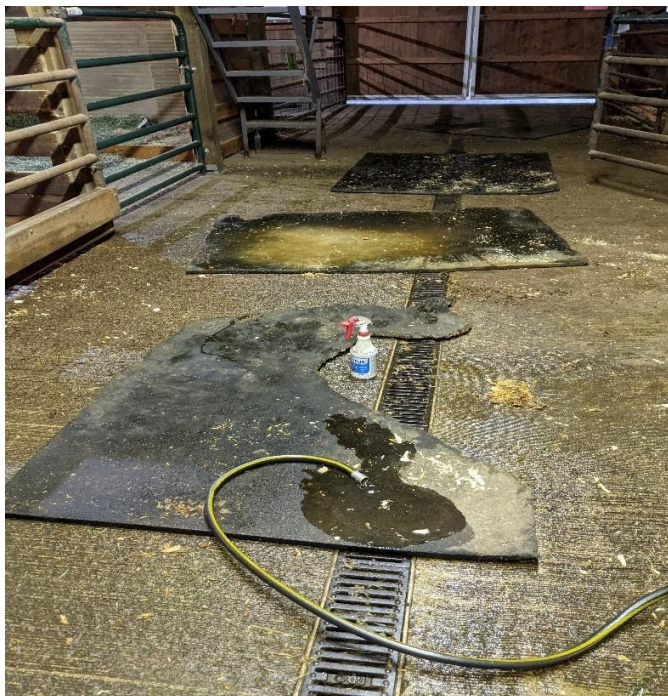

3. Remove the mats from the stall (Note: they are extremely heavy and will require multiple people to move them).
4. Sweep up any debris that was under or between the mats.

5. Use the hose, pressure washer, and Rescue to clean both sides of the mats and the stall.

6. The large fan can be set up to help dry out the stall and/or mats.
7. Sprinkle Stall Dry on the floor of the stall.

8. Place the mats back in the stall, being careful to refer back to the original picture that you took. (Note: this after picture does not match the original picture, but they typically would.)

9. Replace the shavings, buckets (with water in them), and mineral blocks.
